AMENDMENTS TO THE CLAIMS

1. (CURRENTLY AMENDED) In a method for implementing an event

transfer system of a real time operating system kernel under a multi-tasking

environment in which a priority-based preemptive scheduling is adapted, a

method for implementing an event transfer system of a real time operating

system kernel for a plurality of tasks in the multi-tasking environment,

comprising:

each of said tasks calling a kernel system function for receiving an event

with respect to one event under the multi-tasking environment; and

blocking each of said tasks and inserting each of said tasks into a

waiting-list for the event in priority order when no event is provided to the

tasks, wherein all of said tasks are queued and prioritized within said waiting-

list for the event;

checking a validity of an event ID for thereby generating an error code in

the case of validity when the kernel system function of receiving the event

starts; and

returning the routine from the kernel system function;

wherein in the case that the event transfer occurs, the task having the

highest priority in the waiting-list obtains the event, is activated and an

execution of said highest priority task is resumed and when transferring the

Amendment dated August 13, 2004 Reply to Office Action of May 20, 2004

Page 3 of 20

event, the method further includes checking whether any waiting task exists in

the waiting-list for the event.

2. (PREVIOUSLY PRESENTED) The method of claim 1, wherein said

waiting-list for the event is managed based on the priority order so that the

task having the highest priority is arranged at the most leading portion (head)

of the waiting-list.

3. (PREVIOUSLY PRESENTED) The method of claim 1, further

comprising:

checking whether there is an event value already sent, when the kernel

system function of receiving the event starts.

Claims 4 and 5 (CANCELLED)

6. (CURRENTLY AMENDED) In a method for implementing an event

transfer system of a real time operating system kernel under a multi-tasking

environment in which a priority-based preemptive scheduling is adapted, a

method for implementing an event transfer system of a real time operating

system kernel for a plurality of tasks in the multi-tasking environment,

comprising: The method of claim 1, further comprising:

each of said tasks calling a kernel system function for receiving an event

with respect to one event under the multi-tasking environment; and

blocking each of said tasks and inserting each of said tasks into a

waiting-list for the event in priority order when no event is provided to the

tasks, wherein all of said tasks are queued and prioritized within said waiting-

list for the event;

checking a validity of the an event ID for thereby generating an error

code in the case of validity when the kernel system function of receiving the

event starts; and

returning the routine from the kernel system function, wherein in the

case that the event transfer occurs, the task having the highest priority in the

waiting-list obtains the event, is activated and an execution of said highest

priority task is resumed.

Claim 7 (CANCELLED)

8. (CURRENTLY AMENDED) In a method for implementing an event

transfer system of a real time operating system kernel under a multi-tasking

Page 5 of 20

Appl. No. 09/528,028

Amendment dated August 13, 2004

Reply to Office Action of May 20, 2004

environment in which a priority-based preemptive scheduling is adapted, a

method for implementing an event transfer system of a real time operating

system kernel for a plurality of tasks in the multi-tasking environment,

comprising: The method of claim 1,

each of said tasks calling a kernel system function for receiving an event

with respect to one event under the multi-tasking environment; and

blocking each of said tasks and inserting each of said tasks into a

waiting-list for the event in priority order when no event is provided to the

tasks, wherein all of said tasks are queued and prioritized within said waiting-

list for the event;

wherein in the case that the event transfer occurs, the task having the

highest priority in the waiting-list obtains the event, is activated and an

execution of said highest priority task is resumed and wherein when

transferring the event, the method further comprises: includes checking

whether any waiting task exists in the waiting-list for the event.

Claims 9-11 (CANCELLED)

12. (PREVIOUSLY PRESENTED) The method of claim 3, wherein as a

result of the check whether the event value exists, when the event value exists,

Appl. No. 09/528,028 Amendment dated August 13, 2004

Reply to Office Action of May 20, 2004

the event value is obtained and the event control block buffer, and the task

routine is executed by the sort of the event.

13. (PREVIOUSLY PRESENTED) The method of claim 3, wherein as a

result of the check, when the event value does not exist, the current task is

blocked and queued into the waiting-list for the event.

14. (PREVIOUSLY PRESENTED) The method of claim 3, wherein when

the kernel system function of receiving the event starts, the method further

comprises:

checking a validity of an event ID for thereby generating an error code in

the case of invalidity; and

returning the routine from the kernel system function.

15. (PREVIOUSLY PRESENTED) The method of claim 8, wherein as a

result of the check that whether the task exists in the waiting-list, when the

waiting task does not exist, an event value is stored in an event buffer of an

event control block.

16. (ORIGINAL) The method of claim 8, wherein as a result of the check

whether the task exists in the waiting-list, when the waiting task exists, an

event value is transferred to the head task of the waiting-list.

17. (CURRENTLY AMENDED) A method for implementing an event

transfer system of a real time operating system kernel for a plurality of tasks in

a multi-tasking environment, the method comprising:

each of said tasks calling a kernel system function for receiving an event

with respect to one event in the multi-tasking environment; and

blocking execution of each of the tasks and inserting each of the tasks

into a waiting-list for the event according to a priority order when no event is

provided to the tasks, wherein all of said tasks are queued and prioritized

within said waiting-list for the event;

checking whether any waiting task exists in the waiting-list for the event

when transferring the event; and

transferring an event value to the head task of the waiting-list when said

checking indicates that the waiting task exists in the waiting-list; and

wherein when the kernel system function of receiving the event starts,

the method further includes checking a validity of an event ID to thereby

Docket No. 0630-1060P Appl. No. 09/528,028 Amendment dated August 13, 2004 Reply to Office Action of May 20, 2004 Page 8 of 20

generate an error code in the case of invalidity; and returning the routine from the kernel system function.

18. (PREVIOUSLY PRESENTED) The method of claim 17, further comprising:

accessing the task having the highest priority from the waiting-list for the event when the event is provided; and

executing the accessed task.

19. (PREVIOUSLY PRESENTED) The method of claim 17, further comprising:

checking whether an event value exists when the kernel system function of receiving the event starts.

20. (PREVIOUSLY PRESENTED) The method of claim 19, wherein as a result of said checking, the current task is blocked and queued into the waiting-list for the event according to the priority order if the event value does not exist.

Docket No. 0630-1060P Appl. No. 09/528,028 Amendment dated August 13, 2004 Reply to Office Action of May 20, 2004 Page 9 of 20

21. (PREVIOUSLY PRESENTED) The method of claim 19, further comprising:

obtaining the event value from an event control block storage and executing the task routine when said checking indicates that the event value exists.

22. (CURRENTLY AMENDED) A method for implementing an event transfer system of a real time operating system kernel for a plurality of tasks in a multi-tasking environment, the method comprising: The method of claim 17,

each of said tasks calling a kernel system function for receiving an event with respect to one event in the multi-tasking environment; and

blocking execution of each of the tasks and inserting each of the tasks into a waiting-list for the event according to a priority order when no event is provided to the tasks, wherein all of said tasks are queued and prioritized within said waiting-list for the event; wherein when the kernel system function of receiving the event starts, the method further emprises: includes

checking a validity of an event ID to thereby generate an error code in the case of invalidity; and

returning the routine from the kernel system function.

Page 10 of 20

23. (CURRENTLY AMENDED) A method for implementing an event

transfer system of a real time operating system kernel for a plurality of tasks in

a multi-tasking environment, the method comprising:

each of said tasks calling a kernel system function for receiving an event

with respect to one event in the multi-tasking environment;

blocking execution of each of the tasks and inserting each of the tasks

into a waiting-list for the event according to a priority order when no event is

provided to the tasks, wherein all of said tasks are queued and prioritized

within said waiting-list for the event; The method of claim 17, further

comprising:

checking whether any waiting task exists in the waiting-list for the event

when transferring the event; and

transferring an event value to the head task of the waiting-list when said

checking indicates that the waiting task exists in the waiting-list.

24. (PREVIOUSLY PRESENTED) The method of claim 23, wherein said

head task in the waiting-list which receives the event value is adjusted to a

ready state and is inserted into a ready list, and an additional process routine

by the sort of the event is executed.

Docket No. 0630-1060P Appl. No. 09/528,028 Amendment dated August 13, 2004 Reply to Office Action of May 20, 2004 Page 11 of 20

- 25. (NEW) The method of claim 13, wherein when the current task is queued into the waiting-list, a time out option is additionally set if it exists.
- 26. (NEW) The method of claim 15, wherein said head task in the waiting-list which receives the event value is adjusted to a ready state and is inserted into a ready list, and an additional process routine by the sort of the event is executed.
